NoUva pitch

Picture this: you are a student in your High School, and you are trying to discover what you want to study at the university, but you are not sure about if you have the required skills for that major and also you don´t know which university is the best option for you.

Currently this is a reality for a lot of students in El Salvador, 67% of university School dropout are due to vocational problems, abandoning or making the wrong major choice. Approximately 500,000 students. The lack of vocational guidance and limited access to information make it difficult for young people to make informed decisions. As a result, many choose the wrong major or drop out after a short time.

To solve this problem, we created NoUva, a web platform that allows people to develop the skills they need for the major they want through challenges designed to improve skills, such as logic, analytical thinking, mathematical reasoning, and others. Also, people can get informed about universities and majors that are available in every university, and in this way, they can choose where is better for them. But not just that, people will have the opportunity to listen to podcasts where students or graduates talk about how life is studying a certain major.

By using NoUva, students feel more confident when making decisions about their academic future, which reduces stress and allows them to focus better on their studies. This helps them choose options that match their interests and strengths. Additionally, they gain a clearer understanding of what it means to study a certain major and how to plan their academic path, which increases their motivation and the likelihood of success in university and their future professional life.

Moreover, we added a subscription to make your experience a complete adventure. For just $0.99, you can access more podcasts where you will be able to submit questions that will be answered in the next episode.

NoUva is the only platform that combines skill-building challenges, podcasts, and university information, all in one place.

But which technologies did we used?

Well for our web-site we used:

HTML: to build the structure of the website.

JavaScript: to make the site interactive and dynamic.

Figma: used it to design the user interface.

MySQL: to manage the database.

Python: used it to connect the website to the database.

And also Scrum: an agile methodology we used to organize tasks, collaborate effectively, and ensure iterative progress.

In addition, designed with guidance from educational experts, NoUva provides reliable tools for students to explore and prepare for their future. Plus, the platform is designed to be engaging and

easy to use, so students can explore at their own pace and enjoy the learning process. Finally, everything is available online, so students can access it anytime, anywhere, making it flexible for their busy schedules.

This amazing website was created to help you—yes, you—grow and discover your true calling. This is not just any site: it was made with you in mind, focusing on your interests as a student. Here, you'll find support and tools to help you move forward and build your future.

So, what are you waiting for?
Your vocation is waiting for you!
